Page 1

The MT3-0113LCQG is a triple balanced passive diode GaAs MMIC mixer offering high dynamic range, low conversion loss, and excellent repeatability. As with all T3 mixers, this mixer offers unparalleled nonlinear performance in terms of IIP3, P<sub>1dB</sub>, and spurious performance with a flexible LO drive requirement from +11 dBm to +24 dBm. The MT3-0113LCQG is available in a surface-mount outline, or in an SMA connectorized evaluation fixture. The MT3-0113LCQG is a superior alternative to Marki Microwave carrier and packaged T3 mixers, and is form-fit compatible with legacy T3's in the CQ and CQG footprints.

**Configuration A**

**Configuration B**

1. Configuration A/B refer to the same part number (MT3-0113LCQG) used in one of two different ways for optimal spurious performance. For the lowest conversion loss, use the mixer in Configuration A (port 1 as the LO input, port 3 as the RF input or output). If you need to use a lower LO drive, use the mixer in Configuration B (port 1 as the RF input or output, port 3 as the LO input). For optimal spurious suppression, experimentation or simulation is required to choose between Configuration A and B. For more information, [see here](#).

I/O Connections & Ground Plane Finish is Gold Flash, 5 to 10  $\mu$ -inches, over Solderable Nickel, 100-200  $\mu$ -inches, over Cu.

**Downconversion Spurious Suppression**

Spurious data is taken by selecting RF and LO frequencies ( $\pm mLO \pm nRF$ ) within the RF/LO bands, to create a spurious output within the IF band. The mixer is swept across the full spurious band and the mean is calculated. The numbers shown in the table below are for a -10 dBm RF input. Spurious suppression is scaled for different RF power levels by  $(n-1)$ , where “n” is the RF spur order. For example, the  $2RF \times 2LO$  spur is 65 dBc for the A configuration for a -10 dBm input with a sine-wave LO, so a -20 dBm RF input creates a spur that is  $(2-1) \times (-10 \text{ dB})$  dB lower, or 75 dBc.

**Typical Downconversion Spurious Suppression (dBc): A Configuration (B Configuration), Sine Wave LO <sup>6</sup>**

<b>-10 dBm RF Input</b>	0xLO	1xLO	2xLO	3xLO	4xLO	5xLO

**Typical Downconversion Spurious Suppression (dBc): A Configuration (B Configuration), Square Wave LO <sup>6</sup>**

<b>-10 dBm RF Input</b>	0xLO	1xLO	2xLO	3xLO	4xLO	5xLO

**Upconversion Spurious Suppression**

Spurious data is taken by mixing an input within the IF band, with LO frequencies ( $\pm mLO \pm nIF$ ), to create a spurious output within the RF output band. The mixer is swept across the full spurious output band and the mean is calculated. The numbers shown in the table below are for a -10 dBm IF input. Spurious suppression is scaled for different IF input power levels by (n-1), where “n” is the IF spur order. For example, the 2IFx1LO spur is typically 62 dBc for the A configuration for a -10 dBm input with a sine-wave LO, so a -20 dBm IF input creates a spur that is (2-1) x (-10 dB) dB lower, or 72 dBc.

**Typical Upconversion Spurious Suppression (dBc): A Configuration (B Configuration), Sine Wave LO <sup>6</sup>**

**DATA SHEET NOTES:**

- Mixer Conversion Loss Plot IF frequency is 100 MHz unless otherwise specified.
- Mixer Noise Figure typically measures within 0.5 dB of conversion loss for IF frequencies greater than 5 MHz.
- Conversion Loss typically degrades less than 0.5 dB at +100°C and improves less than 0.5 dB at -55°C.
- Unless otherwise specified, sine-wave data is taken with +15 dBm LO drive.
- The square-wave LO is generated using an [ADM-0012-5931SM](#) pre-amplifier and an [ADM-0026-5929SM](#) output amplifier. The two amplifiers are biased with +7V, -0.25V. When specified, square-wave output power is the total of the fundamental plus harmonics. Unspecified square-wave LO (unspecified output power) is generated by saturating the amplifier chain with a +12 dBm input.
