1. Device Overview

1.1 General Description
NLTL-6794SM is a MMIC non-linear transmission line (NLTL) based comb generator. This NLTL offers excellent phase noise performance over a low 100MHz to 1 GHz input frequency range with output tones beyond 30 GHz. NLTL-6794SM is fabricated with GaAs Schottky diode-based varactors and packaged into a surface mount 6x6 mm² QFN.

1.2 Features
▪ Low Phase Noise
▪ Broadband Input Frequencies
▪ No External DC Bias Required

1.3 Applications
▪ Comb Line Generation
▪ High Efficiency Multiplication
▪ Samplers
▪ Phase Locked Loops

3. Application Information

![Internal Structure Diagram]

3.1 Detailed Description
The NLTL-6794SM belongs to Marki Microwave’s NLTL family of multipliers and non-linear transmission lines. The NLTL product line consists of passive GaAs MMIC non-linear transmission lines designed and fabricated with GaAs Schottky diode-based varactors. NLTLs take an input signal and create an impulse train of harmonics. Harmonic outputs up to and beyond 30 GHz are generated by the NLTL. The NLTL-6794SM is a 6 mm QFN and the EVAL-NLTL-6794 is a connectorized module with the QFN reflowed onto a PCB.

Port 1 supports up to 1GHz input signals. Port 2 will output integer multiples of the input signal (i.e., x2, x3, x4, etc.) up to a maximum of ~30 GHz given a -60dBm threshold. Higher harmonics are generated but at a lower efficiency.

The operating conditions of the NLTL are extremely important to optimize performance. High power inputs will increase the output power observed; however, the conversion efficiency will decrease. This is increasingly true for higher input frequencies and at input powers above the recommended limit. Optimal conversion efficiency of the NLTL is achieved using a square wave input with a fast rise time. Doing so causes a degradation in the 2nd output harmonic but otherwise improves the conversion efficiency at all other harmonics. It is for this reason that the typical performance plots in section 4.6 are shown driven with a sine wave input as well as with two amplifiers, the ADM1-0026PA, a square wave driver amp, and the APM-7098PA, a low phase noise amplifier. Section 4.6.7 shows the results of these driver amplifiers in time and frequency domain.

NLTL-6794SM requires no external DC bias. The self-bias of the diodes caused by the rectified RF input signal is sufficient for operation. For the best performance, optimization of the DC return path through a bias resistor is recommended for each specific application to optimize the harmonic output power distribution.

The phase noise of a non-linear transmission line is outstanding. If verification of performance is necessary, the application circuit used and input conditions are extremely important. NLTLs are AM sensitive. If there is excessive AM noise on the input of the NLTL, observing the output of the NLTL will show excessive PM/phase noise because of the high AM to PM conversion property of NLTLs.
3.2 Application Circuit: SM Package and EVAL Package

**DC Path to Ground** — An RF choke followed by a bias resistor should be used to provide a DC path to ground on the input port of the NLTL SM package. The current through the resistor will create Johnson/white noise; a shunt capacitor (for example 1uF) is used to filter noise generated by the resistor. This forms the circuit which self-biases the NLTL. The DC return to ground removes DC rectified current created by high power RF signal injection. A conical coil inductor is recommended to push the self-resonance frequency of the inductor past the operating bandwidth of the NLTL. The recommended inductance value of the conical coil inductor is 50nH or higher. If using a connectorized application setup, a bias tee will provide a DC path to ground and the NLTL can be biased with an additional resistor on the bias tee. See section 4.6.4 for output power vs bias resistor plots.

**Blocking Capacitor** — A DC blocking capacitor on the output of the NLTL-6794SM’s integrated circuit is there to prevent unwanted DC current flow from or to the output. If there is a DC signal on the input, place a DC block or bias tee on the input to avoid disrupting the self-biasing of the diodes.
4. Specifications

4.1 Absolute Maximum Ratings
The Absolute Maximum Ratings indicate limits beyond which damage may occur to the device. If these limits are exceeded, the device may be inoperable or have a reduced lifetime.

4.3 Recommended Operating Conditions
The Recommended Operating Conditions indicate the limits inside which the device should be operated to guarantee the performance given in Electrical Specifications. Operating outside these limits may not necessarily cause damage to the device, but the performance may degrade outside the limits of the electrical specifications. For limits, above which damage may occur, see Absolute Maximum Ratings.

4.4 Sequencing Requirements
This is a passive NLTL that requires no external DC bias. Self-bias of the diodes is sufficient for operation. It is not required, but is recommended to provide a 50Ω termination to each port before applying RF power.
## 4.5 Electrical Specifications

The electrical specifications apply at $T_A=+25^\circ C$ in a 50Ω system. Typical data shown is for the NLTL used in the forward direction with a +20 dBm 250MHz sine wave input and no bias resistor (open circuit) unless otherwise stated. Min and Max limits apply only to our connectorized units and are guaranteed at $T_A=+25^\circ C$. All bare die are 100% DC tested and visually inspected.

Approximate Harmonic Output Power with 100 MHz Input

$$P_{\text{Harmonic}} = -0.82 \times (\text{Harmonic Order}) - 10.7$$

Approximate Harmonic Output Power with 250 MHz Input

$$P_{\text{Harmonic}} = -0.6 \times (\text{Harmonic Order}) - 3.3$$

Approximate Harmonic Output Power with 500 MHz Input

$$P_{\text{Harmonic}} = -1.1 \times (\text{Harmonic Order}) + 4.2$$

Approximate Harmonic Output Power with 750 MHz Input

$$P_{\text{Harmonic}} = -1.9 \times (\text{Harmonic Order}) + 5.5$$

Approximate Harmonic Output Power with 1 GHz Input

$$P_{\text{Harmonic}} = -2.8 \times (\text{Harmonic Order}) + 6.0$$

---

2 Square Wave input generated using either the ADM1-0026PA or the APM-7098PA amplifier at +7V/-0.3V and +8V/+8V respectively.

3 Input power to square wave driver amps is lower but high enough to saturate the amplifier. Power levels in square wave plots refer to input power to the amplifier, not the amplifier’s output power.

4 The Highest Frequency Harmonic Output was determined as the highest frequency harmonic that was above a -60dBm threshold as seen on a spectrum analyzer.

5 Approximate Harmonic Output Power equations are determined by taking points on the output comb on a spectrum analyzer and creating a linear fit equation to relate the harmonic order to its power level. Consequently, the equations offer an approximation of output harmonic level, not an exact measurement.
4.6 Typical Performance Plots
Input power levels refer to drive level going into the NLTL chain input in section 3.2. Square wave plots are referenced to drive level entering the square wave driver amplifier, not the output power of the amplifiers.
